Ennov Process
Business Process Management Software

Our comprehensive and fully-integrated Business Process Management software can help streamline your business operations, ensure compliance and increase your overall efficiency.

The BPMS Challenge

Regulated companies must control their business processes for both quality and regulatory reasons. At the same time, they must make these processes as efficient and effective as possible to decrease time to market and remain competitive.

Manual, paper-based processes can get bogged down and are very hard to manage, track and control. They are also slow, error prone and notoriously difficult to scale and deploy globally.

If these challenges seem all too familiar, our comprehensive fully-integrated BPMS, Ennov Process, can help streamline your business operations, ensure compliance and increase your overall efficiency.

Streamline Any Business Process

Ennov Process allows you to automate your business processes and enforce the activities, participants and traceability required by your SOPs using our visual form builder and graphical workflow modeling utilities. Ad hoc processes or those that remain stalled for months are a thing of the past.

The "smart" data form associated with the workflow retains all of the information required at each process step and provides each participant with the information they need, in the proper context, to complete their tasks on time. Managers can monitor any workflow, visualize pending and completed tasks and intervene when tasks become delayed.

Automatic alerts, email notifications and escalations keep your processes on schedule and your business running smoothly.

Core Capabilities

Graphical workflow designer
Powerful workflow engine that supports subprocesses
Visual forms editor
"Smart" forms that adapt to process step and role
Manual or automated task execution
Real-time monitoring with dashboards and statistics
Full text and metadata based searching
REST API for advanced integration and automation
